

## **Outline**

The following is a general outline describing the implemented features as per the clients requests. Please note that this is my original, unique code, which I independently developed. Furthermore, I also developed the design and HTML independently as well, for which i've included a PDF file displaying the front-end of the web page.

I've included the code for the solely for the administration section of the website, as this is primarily where most of the coding was done. Essentially what I provided the client with was a dynamic product management system specifically catered to their requirements.

## **HTML**

- Custom design layout, as per HTML standards
- CSS Styling
- Custom slideshow displaying various "featured products" programmed in javascript.

## **Programming**

- Custom contact submission form. The form will submission will be via email.
- Search bar, which searches *categories* and *products* returning matching queries
- Custom administration panel, which will include the following pages:
  - Unique login credentials, preventing unauthorized access.
  - Add products: featuring the ability to upload a pic and resize it to keep all the images uniform. Along with entry boxes for Title, price and category.
  - Remove products: on this page you will be able to remove products
  - Edit products: on this page you will be able to edit products
  - Modify slideshow: add or remove images from the slideshow
  - Modify categories: add or remove categories including sub-categories.
